

# *Varen* SMD Transient Voltage Suppressors

## *Array Series*

---

**ARRAY-series** is a Suppressor Array device designed for the transient voltages that exist at the circuit board level. This device provides four independent suppressors in a single “0402” and “0603” Leadless chip in order to reduce part count and placement time as well as save space on printed circuit boards. This type is intended to suppress ESD, EFT and other transients in order to protect integrated circuits or other sensitive components operating at any voltage up to 18Vdc. A very good protection for systems.

Array series will be available in the end of year 2002, please consult with Sales Department for availability.
